### **REMARKS**

Applicant herein responds to the outstanding Office action.

#### **The Claims Recite At Least One Novel Feature Over The Cited Reference**

The Examiner has maintained the previous rejection of all pending claims under 37 U.S.C. 102(e) as anticipated by Sanford (US 6,536,039). For the reasons explained below, Applicants respectfully disagree. While various claims have been clarified, these remarks focus on independent claims 1, 6, 11 and 12, since if these claims are found patentable, their respective dependent claims will be patentable as well.

Amended independent claims 1, 6, 11 and 12 to more clearly recite a major novel feature of the present invention over the Sanford reference. Specifically, the present invention updates by downloading and storing in the computer's hard drive only the actual differences in digital information between new updates and the original content data on the CD, rather than by downloading entire program modules, as taught by Sanford. This novel feature of the present invention is further distinguished from Sanford in the discussion set out below. The language of the claims has been additionally clarified by substituting the term "information" for the term "data." These two terms are essentially interchangeable, as explained in the application as filed, on page 9, line 4.

The Sanford reference describes a "program module" as algorithms, content, or both (see column 3, lines 37-39). Nevertheless, Sanford requires that discrete "program modules" be pre-identified for the user by listing on the screen display and requires that the user choose to either select one of these pre-identified program modules or select a new program module (see FIG. 1, blocks 105 and 120). Thus, in order to download a change, the user must download a pre-identified program module, which includes changed digital

---

information, but also includes portions of the program module which have not been changed. Accordingly, the Sanford invention suffers from certain inefficiency.

In contrast, however, the presently claimed invention does not require that program modules be pre-identified because **updating downloads consist only of the differences in the content between the original digital information and the updated or new information**, so that it is immaterial where these differences occur and the invention avoids having to download unchanged content along with the changed content. For an explanation of how this feature of the present invention operates, please see the application as filed at page 12, line 24, through page 13, line 19.

The Sanford reference teaches that the user may choose to download updated or new program modules. **"The user can download individual updated program modules and/or content, instead of an entire software program or complete content, from a designated information site through a data server to a PC hard disk drive during a program run."** See col. 2, lines 11-16; emphasis added. **"The user can download the updated program modules as needed during the program run."** See col. 2, lines 24-25; emphasis added. **"If the user chooses to download a new program module . . . .** The new program module will be run from the PC hard disk drive." See col. 2, lines 53-54 and 61-62; emphasis added. **"The user may download updated program modules from the designated information site to the PC hard disk drive as needed during a program run."** See, col. 3, lines 4-6; emphasis added. **"The user can download the updated program modules as needed during the program run."** See col. 5, lines 49-50; emphasis added.

Those skilled in software understand that a "module" is a self-contained part of a larger set of digital information, that is, a small program that handles a specific function or routine, as recognized by the Examiner. From its description, it is clear that the Sanford invention teaches updating CD files by downloading and storing only complete program

modules to the computer's hard drive. Several further examples of Sanford's description are listed below which support that interpretation.

"The finite set of program modules listed on the main screen reside on the CD. However, if the chosen program module also exists on the PC hard disk drive, **the program module on the PC hard disk drive is a replacement program module for the original program module residing on the CD.** One or more of the finite set of program modules on the CD may be replaced by replacement program modules." See col. 3, lines 61-66; emphasis added.

"Replacement of one of the finite set of program modules on the CD occurs by **downloading a replacement program module** from the designated information site through the data server to the PC hard disk drive." Sanford, col. 4, lines 1-5; emphasis added.

"If a **replacement program module for the chosen program module exists on the PC hard disk drive** 106, then the program runs the chosen program module residing on the PC hard disk drive 110. If a replacement program module does not exist for the chosen program module, the program runs the chosen program module residing on the CD 115. The user may then run another program module from either the CD or the PC hard disk drive from the main screen 101." See col. 4, lines 41-49; emphasis added.

"**Downloading individual program modules during a program run** deletes the extra step of downloading the entire updated software program before running the updated software program. Also, **downloading individual modules from the information site as needed** can be done in a more timely manner than using an updated software program on the designated information site by direct interactivity between the user's PC and the designated information site." See col. 5, 37-45; emphasis added.

"Therefore, the present invention [by Sanford] provides users with seamless interconnectivity between program modules on a CD, ***downloaded program modules on a PC hard disk drive, and any replacement or additional program modules on the designated information site.***" See col. 6, lines 13-17; emphasis added.

Applicants respectfully point out that it is clear that Sanford's teaching is limited to downloading complete program modules, whereas the present invention as recited in the claims calls for downloading *only differences in digital content between the original and the new or updated information*. Thus, the present invention functions much more efficiently than Sanford's, which requires downloading a complete program module, including the portions of the program module in which no changes were made to the digital information.

Since the claimed invention recites at least that novel feature not disclosed by Sanford, there is no anticipation by that reference. Applicants, therefore, respectfully request that the Examiner withdraw the rejection of the claims on that basis.

### Conclusion

In view of the amendments and the remarks presented herein, it is submitted that the pending independent claims are patentable. In addition, their respective dependent claims, which recite yet further distinguishing features, are also patentable and require no further discussion.
